

Renewable energy is widely used to support business sustainability goals and meet voluntary and compliance requirements the world over. Combined with measurement and conservation, supporting emissions reductions through wind power credits and other offsets helps you meet expectations and showcase your leadership to valuable stakeholders.

Certified Renewable Energy

Renewable Choice Energy was one of the first in the industry to provide Green-e Energy® certified renewable energy credits/certificates (RECs) and today is a leader in renewable energy sales to homes and businesses across the U.S. When you purchase RECs for your business, you reduce the environmental impact of your electricity use, help reduce U.S. dependence on fossil fuel, and support wind power developers striving to succeed in a highly competitive non-renewable fuel-based energy market.

Verified Carbon Offsets

Renewable Choice provides third-party verified carbon offsets to companies looking to reduce the environmental impact of their flying, driving, heating and manufacturing with real, permanent carbon reductions. We support variety of domestic and international carbon projects that conform to leading standards.
